Plugin Installation

General procedures for plugin installation, update, and removal

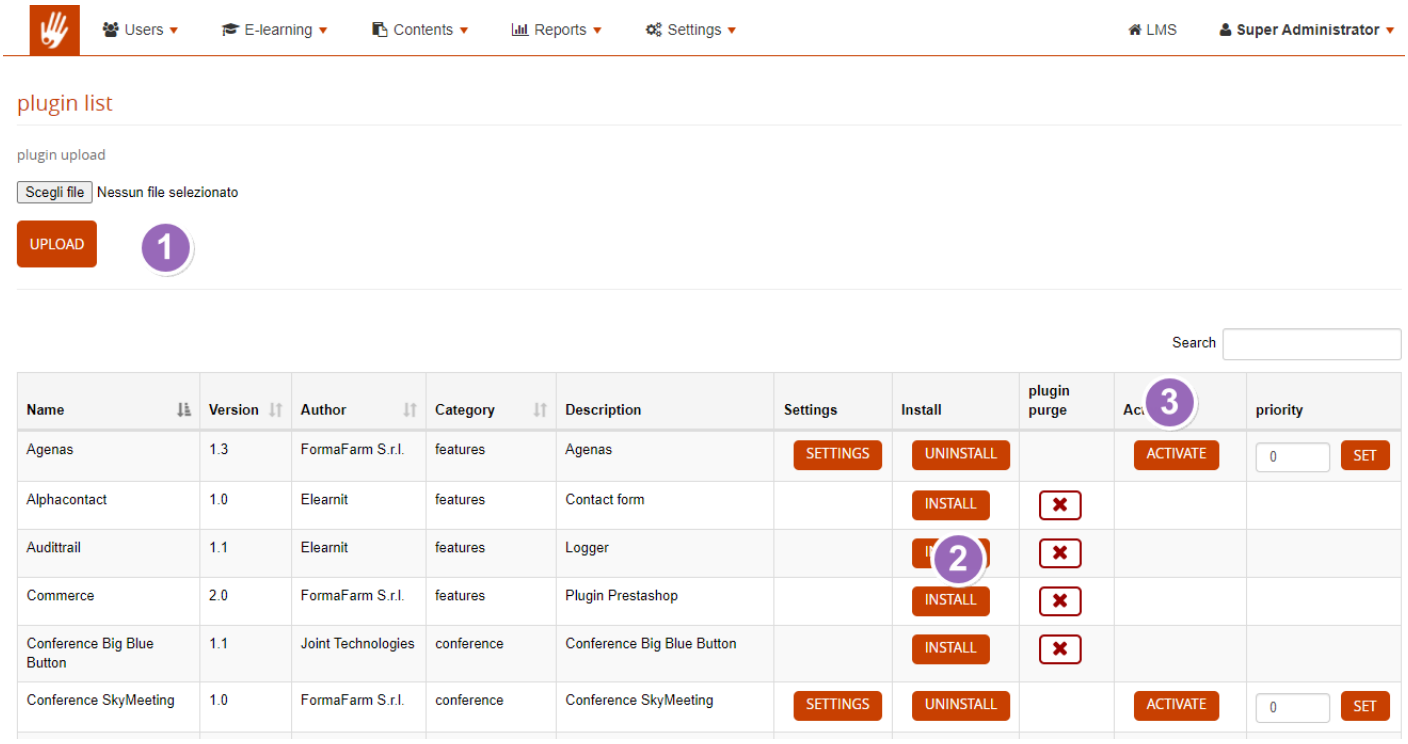

> Please note that since January 2025 Forma Cloud plugins are not available anymore for public download. This page is kept as a reference only for legacy users.

Plugin installation

You can install the plugin by uploading the installation zip package from the **Forma LMS plugin manager**. Log in your Forma installation as super-administrator and browse to:

admin > settings > plugin manager

1. Select the zip file from your computer and click upload. The plugin will now be listed in the available plugins table.
2. Click “plugin Install”
3. Click on “plugin activate”

Plugin removal

To remove the plugin, go to settings > plugin manager and::

1. Click “Deactivate”
2. Click “Uninstall”
3. Click “Plugin Purge”

Plugin Update

To update or reinstall the plugin:

1. Follow the uninstall procedure
2. Go to Settings > System Configuration > Advanced > click “Clear Twig Cache”

What happens if I installed the wrong version and my Lms crashes?

Never mind, you can always disable a plugin from your DB by setting to 0 the value of the “active” field in the core plugins table. This is the query you have to launch from the SQL panel of phpMyAdmin to modify the field:

```
UPDATE `core_plugin` SET `active` = 0 WHERE `name` = 'Coursealert';
```

Of course this is an example based on Coursealert. Replace the value with the name of the plugin you want to disable.

Translations

Plugin translations can be edited and managed via the standard Forma language manager.

Just search for some word or filter by the selected plugin, and translate as for any other Forma label.
